

RecoverNow Quick Start

One issue you probably face as you strive to maintain the availability of important production data is that technicians and users occasionally delete data without intending to do so. Or, data can be accidentally corrupted and rendered useless because of a system malfunction. Either way, you can't afford to lose your data. Ever.

Vision's RecoverNow allows you to recover operations after these kinds of "mini-disasters" more effectively than with tape, because you can recover data at virtually any point in time. This helps you reduce your recovery point objectives significantly and cost effectively.

The RecoverNow Quick Start service accelerates your path to worry-free data recoverability with faster, simpler implementation. In addition, as part of this package, Vision will document and verify your implementation and transfer to your staff the skills necessary to administer, monitor and audit RecoverNow.

The RecoverNow Quick Start service includes several important components:

- First, Vision will conduct a site survey and a project planning meeting to review your requirements.
- Vision will then, with your assistance, install RecoverNow, apply any required PTFs and ensure that the license is activated.
- Next, technicians will verify that your implementation of RecoverNow is functioning optimally.
- The details of your implementation will then be documented.
- Finally, your staff will be trained on how to use RecoverNow, including performing required operations and administration tasks, running RecoverNow saves and restores, and using all the powerful utilities and functions provided with the solution.

To learn more about Vision's RecoverNow Quick Start service, call **800-957-4511** or visit **visionsolutions.com**.

Benefits

- Shorter implementation project cycle and more efficient use of staff.
- Expert, fully customized Implementation.
- Immediate proficiency in using RecoverNow.

Deliverables:

- Site survey and implementation planning.
- Installation and configuration of RecoverNow on a pair of systems or LPARs (one source and one target).
- Skills transfer session.

High Availability Disaster Recovery Systems and Data Management
